

ANTIFLAME™ FABRIC.

Our Antiflame™ garments are made in 75% Proban treated cotton and 25% polyester. It's a carefully chosen mixture that doesn't cause allergies or emit toxic gases that can irritate the eyes. And of course it's washable.

CERTIFIED PROTECTION.

All Snickers Workwear Antiflame™ garments fulfil EN 531 for protection against heat and flames and many of them also conform to EN 533.

ON-THE-JOB FUNCTIONALITY.

With our range of Antiflame™ garments you get the renowned Snickers Workwear functionality, protection and working comfort – even in the heat of the moment.

EN 531 PROTECTION AGAINST HEAT. A standard concerning protective garments for workers exposed to heat, designed to protect workers from brief contact with a flame and against at least one type of heat: B, C, D or E: convective, radiant, large projections of molten metal or a combination of these heat hazards.

- A. Limited flame spread:** The material should meet the requirements of limited flame spread in accordance with EN 532. To pass the EN 531 requirements the clothing must also protect against at least one form of heat.
- B. Convective heat:** Heat transported through the garment when exposed to flame. Heat from the flame source can injure the user even if the outer fabric does not burn. At least level B1 shall be met, which is 3–6 seconds to pain. B5 is the highest level.
- C. Radiant heat:** Exposure to low radiant heat over a longer period may cause injuries. Therefore, heat flux is measured against radiant heat. C1 indicates that the fabric meets level 1 which is 8-30 seconds to pain. Level 4 is the highest.
- D. Molten aluminium splash**
- E. Molten iron splash**

0267 Onepiece
